PHOSPHOLIPASE A₂ INHIBITOR

This application is a continuation of now abandoned application Ser. No. 08/267,002, filed Jun. 21, 1994, which is a continuation of now abandoned application Ser. No. 07/983,856, filed as PCT/JP92/00802 Nov. 19, 1992 published as WO93/01157 Jan. 21, 1993.

FIELD OF THE INVENTION

The present invention relates to novel phospholipase A₂ inhibitors. In more particular, the present invention relates to novel compounds exhibiting an inhibiting effect on phospholipase A₂, which compounds are analogs of physiologically active substances, thielocins which are produced by microorganisms such as *Thielavia terricola* RF-143 belonging to Thielavia genus.

THE PRIOR ART

Phospholipase A₂ is an enzyme which exists in a cell and a secretory liquid, in particular, the venom of snakes, pancreas of a mammalian, blood platelets of various animals, arthritis exudate of higher animals, and so on. The enzyme specifically hydrolyzes phospholipids. For example, the enzyme specifically hydrolyzes C-2 fatty acid esters of 1,2-diacylglycerol phospholipids to form lysoglycerophospholipids and fatty acids. Phospholipid A₂ exhibits toxicity on nerve, muscle and heart, and anticoagulant actions in association with the above enzymatic action, and it is generally said that the enzyme may induce convulsant, hypotonia, haemolysis, edema, and so on. Further, the enzyme can also be responsible for other clinical symptoms including inflammations. It should be noted that phospholipase A₂ is recognized to be one of the phlogogenic substances in humans.

If the enzymatic activity of phospholipase A₂, which is a phlogogenic substance can be inhibited, various diseases caused by or associated with the enzymatic activity can probably be treated. Based on such assumption, substances such as mepacrine and p-bromophenacyl bromide have already been developed, and the applicants have also claimed and disclosed novel phospholipase A₂ inhibitors in Japanese Patent Publication (kokai) No. 286088/1990 and Japanese Patent Application No. 234955/1990. However, it is desirable to develop additional phospholipase A₂ inhibitors, because types of the phospholipase A₂ molecules are varied and the activity of one of the molecules is not the same as the other due to the difference of the structure of the molecules.

DESCRIPTION OF THE PRESENT INVENTION

The applicants have filed Japanese patent applications which claim and disclose thielocin A₁α, A₁β, and so on, which are produced by *Thielavia terricola* RF-143 (Japanese Patent Application No. 109939/1989, etc.). Now, the applicants have chemically synthesized new various thielocin derivatives useful as medicine, and established the present invention.

[Step 3]

Compound 124 (1.5 g, 2 mmol), and the benzhydryl ester of thielavin D (1.4 g, 2 mmol) were dissolved in 150 ml of toluene, and 0.24 ml (2 mmol) of boron trifluoride diethyl ether complex was added thereto, and the mixture was stirred at room temperature for 30 minutes. The reaction mixture was diluted with 150 ml of ethyl acetate, washed with water, and then dried (Na₂SO₄). The mixture was evaporated in vacuo, and the residue (3.61 g) was dissolved in 40 ml of methylene chloride, and to the solution were added 0.96 g of anisole and 2.2 g of trifluoroacetic acid under cooling with ice-water, and the mixture was stirred for one hour. The resultant mixture was left standing overnight, and then the solvent was evaporated in vacuo. To the residue was added the dilute hydrochloric acid, and the precipitating oil was collected by decantation, and it was dissolved in ethyl acetate. The ethyl acetate phase was washed with water, dried (Na₂SO₄), and evaporated in vacuo to yield 3.79 g of the crude product. The product was purified by silica gel chromatography (eluent: chloroform—methanol—acetic acid=500:50:25), to yield 1.234 g of the thielocin B3.

To a solution of thielocin A1 (6.5 mg) in 0.3 ml of chloroform were added trimethyl ortho-formate (1.8 ml) and p-toluene sulfonic acid (60 mg), and the mixture was left standing at room temperature for five days. The reaction mixture was distributed between ethyl acetate and water, and the organic phase was dried (Na_2SO_4), and evaporated in vacuo. The residue was purified by thin layer chromatography (Developer: CHCl_3 :MeOH:water 62:25:4, Rf: 0.3) to yield 5.3 mg of 125. M.p. $198^\circ\text{--}200^\circ\text{C}$. EFFECT OF THE INVENTION

The compounds of the present invention were tested for their Phospholipase A_2 inhibitory activity by the following procedure.

Method

1-Palmitoyl-2-[$1\text{-}^{14}\text{C}$]-linoleoyl L-3-Phosphatidylethanolamine (Amersham, Inc., 59 mCi/mmol) were diluted with L- α -phosphatidylethanolamine (Sigma, Co., from egg albumin) [2,000 dpm/nmol], and the dilution was sonicated. The

resultant dilution was used as a substrate. The PLA_2 (phospholipase A_2) which was used in the test was from rat platelets. The PLA_2 and the substrate preparation were added to a solution of CaCl_2 (3 mM) in Tris-buffer (0.1M, pH 7.4), and the mixture was allowed to react at 37°C . for 20 minutes. Then, the reaction was terminated by adding 1.25 ml of Dole's reagent to the reaction mixture and stirring immediately the resultant mixture. To the mixture was added 0.5 ml of distilled water and 0.8 ml of n-heptane, and the mixture was stirred, centrifuged, and the supernatant was taken into another tube. To this supernatant were added additional 0.8 ml of n-heptane and silica gel, and the mixture was stirred, centrifuged, and the supernatant was taken into vials. Toluene cocktail was added to the vials. The amount of free fatty acid released by PLA_2 was determined using liquid scintillation counter.

Inhibitory activity (%) was estimated by the formula: $\frac{[(\text{DPM value at the addition of the inhibitor}) - (\text{DPM value without } \text{PLA}_2)]}{[(\text{DPM value with only } \text{PLA}_2) - (\text{DPM value without } \text{PLA}_2)]} \times 100$.

The results are shown in the following Table 1.
